SearchSignal procedures

Searching for a signal is a complicated issue with many attempts and tries.

Never look for two signals at the same time.

Let us describe a search by a structure on which we can do many operations and then eventually save the result out of the structure and then

```

> TargetSat      := 1:      # -1, 0, 1, 2
TargetP         := 2:      # [r, te, t]
TargetBranch    := 3:      # none is no sat
TargetCol       := 4:      # black, red, blue, green

SourceSat       := 5:      # 0, 1, 2
SourceBranch    := 6:      # ..., -1, 0, 1, ...
SourceCol       := 7:      # black, red, blue, green
PreviousSourceBranch:= 8:  # true | false(D)

```

Scattering ray (rm=17.8635) in [3/2 .. 17.93041370]: target and
source on the same branch.
Counterclockwise ray.
Ray outgoing at target.
Solve Side.
